

KOSOVO 2036 — HUMAN NETWORK

The Social Operating System of Kosovo

1. Project Overview

KOSOVO 2036 — HUMAN NETWORK is a futuristic social infrastructure platform designed to connect people, communities, organizations, businesses, schools, universities, and municipalities across Kosovo.

Unlike conventional social-media platforms, Human Network is not designed around followers, likes, viral content, or endless scrolling.

Its purpose is to answer one fundamental question:

How can technology help people build stronger real-world connections?

The platform creates a digital layer over Kosovo where people can:

- discover activities;
- meet people with shared interests;
- create communities;
- find collaborators;
- discover local opportunities;
- volunteer;
- organize events;
- solve community problems;
- connect different communities;
- find public spaces;
- participate in local initiatives;
- and contribute to the social life of their city.

At the same time, municipalities and organizations can use **anonymous, aggregated data** to understand community needs and improve public spaces, activities, and services.

The central philosophy is:

Technology should not replace human connection. It should make human connection easier.

2. The Problem

Modern digital platforms have made communication easier than ever, but digital connection does not automatically create meaningful social connection.

A person can have hundreds of online contacts while:

- not knowing people in their neighborhood;
- struggling to find people with similar interests;
- being unaware of local activities;
- having difficulty joining new communities;
- not knowing where to volunteer;
- struggling to find collaborators;
- feeling disconnected after moving to a new city;
- or simply not knowing what is happening around them.

At a city level, another problem exists.

Municipalities may know demographic information, but they may have limited visibility into questions such as:

- What activities do young people actually want?
- Which neighborhoods lack social spaces?
- Which public spaces are underused?
- Where are people asking for sports facilities?
- Where are volunteers needed?
- Which communities rarely interact?
- What types of events are missing?
- Where is there high demand but low availability?

Human Network attempts to address both levels:

Individual level

“Help me find people, activities and opportunities.”

Community level

“Help us find people who can work together.”

City level

“Help us understand what our communities need.”

3. Vision

By 2036, Kosovo has a connected digital social ecosystem where physical communities and digital technology work together.

Human Network aims to become:

The digital infrastructure through which people discover, create and strengthen communities across Kosovo.

The platform should make it possible for someone in:

- Prishtina
- Prizren
- Peja
- Gjakova
- Ferizaj
- Gjilan
- Mitrovica
- or any smaller municipality

to discover opportunities to participate in their community.

4. Core Concept

Human Network has **three interconnected layers**.

Layer 1 — PEOPLE

Individuals discover:

- people;
- activities;
- events;
- communities;
- opportunities;

- places;
 - projects.
-

Layer 2 — COMMUNITIES

People form:

- sports groups;
 - technology communities;
 - cultural groups;
 - volunteer organizations;
 - study groups;
 - hobby groups;
 - project teams;
 - neighborhood communities;
 - student communities.
-

Layer 3 — CITY

Aggregated information helps municipalities and organizations understand:

- demand;
- activity;
- community needs;
- underserved areas;
- available resources;
- emerging interests.

This creates a loop:

People → Communities → City → Better opportunities → People

5. Target Users

5.1 Young People

Students and young adults looking for:

- friends;
 - hobbies;
 - sports;
 - events;
 - clubs;
 - study groups;
 - projects;
 - internships;
 - volunteering;
 - competitions.
-

5.2 Adults

People looking for:

- hobbies;
 - professional networking;
 - community activities;
 - sports;
 - volunteering;
 - cultural events;
 - local groups.
-

5.3 New Residents

Someone who moves to another city can enter:

“I just moved here.”

Human Network generates a personalized introduction to the local community.

Example:

Welcome to Prishtina.

Based on your interests, you may enjoy:

- photography group;
- volleyball group;

- coding community;
 - weekend hiking group.
-

5.4 Communities

Existing communities can use Human Network to:

- recruit members;
 - organize events;
 - communicate;
 - find volunteers;
 - find resources;
 - collaborate with other communities.
-

5.5 Schools

Schools can create:

- clubs;
 - competitions;
 - study groups;
 - workshops;
 - volunteer activities;
 - student projects.
-

5.6 Universities

Universities can connect students with:

- clubs;
 - research projects;
 - events;
 - companies;
 - competitions;
 - mentors;
 - other universities.
-

5.7 Businesses

Businesses can:

- publish opportunities;
 - sponsor events;
 - find talent;
 - support community initiatives;
 - organize workshops;
 - collaborate with student communities.
-

5.8 Municipalities

Municipalities receive a separate dashboard showing **anonymous aggregated community trends**.

6. User Account System

Users can create an account using:

- email;
- phone number;
- supported social authentication;
- institutional account where applicable.

The onboarding process should be intentionally interactive.

7. Onboarding

Instead of immediately asking users to create a profile, Human Network asks:

“What do you want to do?”

Users select interests such as:

-  Technology
-  Sports
-  Art
-  Music
-  Education
-  Gaming
-  Environment
-  Volunteering
-  Photography
-  Cooking
-  Travel
-  Science
-  Culture
-  Books
-  Entrepreneurship

Multiple selections are allowed.

8. Social Preferences

Users can optionally define:

- preferred activity size;
- preferred distance;
- available days;
- available hours;
- online/offline preference;
- preferred languages;
- accessibility requirements;
- beginner/intermediate/advanced level.

For example:

Distance: within 5 km

Group: 5–15 people

Availability: Friday evenings

Activities: technology + sports

The recommendation system uses this information.

9. Personal Social Dashboard

The homepage is not a traditional social-media feed.

Instead, it shows:

TODAY

What is happening around you?

- events;
 - activities;
 - opportunities;
 - community needs;
 - groups;
 - nearby public spaces.
-

YOUR NETWORK

- current communities;
 - upcoming activities;
 - active projects;
 - new opportunities;
 - potential connections.
-

10. Live Social Map

One of the main features is the **Live Social Map of Kosovo**.

The map displays activities and community activity geographically.

Users can explore:

Sports

-  Basketball
-  Football
-  Volleyball

-  Running
-  Skiing

Education

-  Study groups
-  Coding workshops
-  Science activities

Culture

-  Theatre
-  Music
-  Art
-  Literature

Community

-  Environmental projects
 -  Volunteering
 -  Neighborhood activities
-

11. Social Heatmap

The map can display an anonymous social activity heatmap.

Users can switch between:

Sports

Education

Culture

Entertainment

Volunteering

Youth

Community projects

The system visualizes where activities are concentrated.

12. Activity Discovery

Users can search:

“What can I do today?”

Filters:

- location;
 - distance;
 - date;
 - time;
 - category;
 - group size;
 - age group;
 - difficulty;
 - accessibility;
 - free/paid;
 - indoor/outdoor.
-

13. AI Activity Recommendation

AI analyzes:

- interests;
- availability;
- location;
- previous activities;
- preferred group size;
- selected goals.

It then creates personalized recommendations.

Example:

You may enjoy this:

Saturday AI Workshop
4.2 km away
12 participants
3 people share your interests

14. Human Matching

This is one of the most important components.

Human Network does **not** primarily match people based on popularity.

Instead, it looks for:

Shared interests

Person A:

Programming + AI

Person B:

Programming + AI

Potential connection.

But it also identifies:

Complementary skills

Person A:

Programming

Person B:

Graphic Design

Person C:

Business

AI:

Potential project team detected.

15. AI Human Network

Every user has a private **Human Network Graph**.

The graph can represent:

- family;
- friends;
- school;
- work;
- hobbies;
- communities;
- projects;
- new connections.

Users control which relationships are visible.

16. The BRIDGE System

BRIDGE = Community-to-Community Discovery

This is the feature that makes the project significantly bigger.

AI identifies communities that could benefit from one another.

Example:

University AI Club

↓

AI discovers

Local Agriculture Community

↓

AI discovers

Environmental Organization

↓

AI discovers

Technology Company

The system proposes:

Potential collaboration detected.

Possible result:

AI + Agriculture + Environment = Smart Farming Project

17. Community Creation

Any eligible user can create a community.

Required:

- community name;
- description;
- category;
- location;
- public/private;
- age requirements where relevant;
- rules;
- language;
- activities.

Examples:

Prishtina AI Community

Peja Hiking Community

Kosovo Young Designers

Gjakova Chess Club

18. Community Pages

Each community has:

- description;
 - members;
 - upcoming events;
 - projects;
 - announcements;
 - discussions;
 - resources;
 - achievements;
 - partner communities.
-

19. Event Creation

Users and communities can create events.

Event information:

- name;
 - description;
 - date;
 - time;
 - location;
 - capacity;
 - category;
 - organizer;
 - accessibility;
 - cost;
 - required equipment;
 - age restrictions where necessary.
-

20. Smart Event Creation

AI can help organizers create an event.

User:

“I want to organize a beginner coding meetup for 15 students.”

AI can generate:

- event description;
 - schedule;
 - recommended location;
 - capacity;
 - checklist;
 - invitation;
 - suggested communities to invite.
-

21. Temporary Communities

Not every connection needs to become permanent.

Human Network can automatically create temporary groups for:

- football games;
- hiking;
- study sessions;
- workshops;
- hackathons;
- volunteer events.

After the event, the group can:

- disappear;
 - become a permanent community;
 - continue as a project.
-

22. Community Projects

A community can create a project.

Example:

“Clean Our Neighborhood”

Project requirements:

- 20 volunteers;
- Saturday;
- equipment;
- location;
- coordinator.

The AI finds people interested in volunteering nearby.

23. Community Needs

Users can report community needs.

Examples:

“Our neighborhood needs a basketball court.”

“There are no coding activities for teenagers here.”

“We need volunteers for the park.”

“Our elderly residents need digital literacy workshops.”

The platform categorizes these needs.

24. AI Community Problem Detection

AI can identify recurring patterns.

If 200 people independently report:

“There isn't enough youth activity in this area.”

The system can identify:

Emerging Community Need

This appears in the municipality dashboard.

25. Municipality Dashboard

A separate interface is available for authorized municipalities.

It does **not** expose individual private information.

Instead it shows anonymous aggregated data.

26. City Social Intelligence

Municipalities can see:

Activity Demand

- sports;
- education;
- culture;
- entertainment;
- volunteering.

Geographic Demand

Which areas have:

- high demand;
 - low activity;
 - unused spaces;
 - community needs.
-

27. Social Opportunity Gap

One of the most important analytics.

The system identifies areas where:

Demand is high + available activities are low.

Example:

Neighborhood X

Youth activity demand:

HIGH

Available activities:

LOW

Suggested intervention:

Create a youth activity center / sports program / workshop.

28. Public Space Intelligence

Municipalities can see which public spaces are:

- highly used;
- underused;
- requested;
- suitable for events.

This could help inform future urban planning.

29. Community Collaboration Dashboard

Municipalities can see anonymized connections between categories.

For example:

Technology ↔ Education

Sports ↔ Youth

Environment ↔ Schools

Culture ↔ Tourism

This reveals opportunities for collaboration.

30. AI City Recommendations

The system can generate recommendations based on aggregated patterns.

Example:

Recommendation

Demand for youth technology activities has increased significantly in this area while existing opportunities remain limited.

Suggested action:

Create a monthly technology workshop.

The recommendation should always be presented as **decision support**, not an automatic government decision.

31. Gamification

Human Network should reward **real-world participation**, not popularity.

Users can earn achievements for:

- joining activities;
- volunteering;
- organizing events;
- helping communities;
- completing projects;
- learning skills;
- connecting communities.

Avoid:

- ✗ follower counts
- ✗ popularity rankings
- ✗ “most liked person”

Instead:

Contribution Score

Measures constructive participation.

32. Community Achievements

Examples:

First Community Event

100 Volunteer Hours

First Collaborative Project

Connected Two Communities

Neighborhood Initiative

Kosovo Community Builder

33. Challenges

The platform can create nationwide challenges.

Example:

“100,000 Connections”

Goal:

Create 100,000 meaningful real-world interactions during one month.

Other challenges:

- 10,000 volunteer hours;
 - 1,000 community projects;
 - connect 100 schools;
 - 500 environmental activities.
-

34. National Community Events

Human Network could coordinate nationwide events.

Example:

“Kosovo Community Day”

Different cities simultaneously host:

- sports;
- workshops;
- concerts;
- volunteering;
- exhibitions;
- technology events.

The platform coordinates the entire network.

35. AI Social Assistant

Users can communicate naturally with the AI.

Example:

“I have nothing to do Saturday and want to meet people who like programming.”

AI:

“I found three activities within 10 km. The closest is a beginner AI workshop with 11 participants.”

36. Natural Language Search

Users can type:

“Find me something outdoors this weekend.”

or:

“I want to meet people who speak German.”

or:

“Find a project where I can use Python.”

or:

“What's happening near me tonight?”

The AI converts natural language into searches.

37. Voice Interface

Users can speak instead of typing.

Example:

“Find me a volleyball game tomorrow.”

AI responds verbally and visually.

This also improves accessibility.

38. Multilingual Support

Core languages:

 Albanian

 English

Potential future languages:

 German

The system should support multilingual communities.

39. Translation

AI can assist communication between people who don't share the same language.

For example:

Albanian → English

This can make mixed communities easier to create.

40. Accessibility

The platform should support:

- screen readers;
- voice navigation;
- large text;
- high contrast;
- colorblind-friendly modes;
- keyboard navigation;
- captions;
- voice input.

Activities should optionally include accessibility information.

41. Safety System

Because the platform connects strangers, safety is essential.

Features:

- verified accounts;
- reporting;
- blocking;
- moderation;
- community rules;
- event reporting;
- organizer verification;
- suspicious behavior detection;
- emergency reporting where appropriate.

For minors, stronger protections should apply.

42. Privacy

Privacy should be a fundamental principle.

Users control:

- profile visibility;
- location visibility;
- activity visibility;
- contact permissions;
- community visibility;
- personal data;
- AI personalization.

Exact location should never automatically be publicly displayed.

43. Anonymous City Data

Municipal dashboards should only receive:

Aggregated information.

For example:

“340 users in this area are interested in sports.”

Not:

“Name, age 17, wants basketball.”

This distinction should be fundamental to the architecture.

44. Location Privacy

Possible modes:

Precise

Used privately for navigation.

Approximate

Shows a general area.

Hidden

No location-based recommendations.

Users can change this at any time.

45. Trust & Verification

Different verification levels:

Standard

Email/phone.

Community Verified

Verified by community organizer.

Organization Verified

School/business/NGO/municipality verification.

Event Organizer

Additional verification for people organizing public activities.

46. Reporting System

Users can report:

- harassment;
- inappropriate content;
- fake accounts;
- unsafe events;
- scams;
- misleading information;
- inappropriate communities.

AI can prioritize reports for human moderators.

47. Notification System

Notifications should be useful rather than addictive.

Examples:

Your event starts in 2 hours.

Three people joined your project.

A community you follow created a new activity.

Your project needs 2 more volunteers.

Avoid constant engagement notifications designed purely to increase screen time.

48. Personal Analytics

Users can see:

My Impact

- activities attended;
- hours volunteered;
- communities joined;
- projects completed;
- people met;
- skills learned;
- events organized.

This turns the platform into a **record of participation**, rather than popularity.

49. Community Analytics

Community organizers can see:

- members;
 - event attendance;
 - participation;
 - growth;
 - project completion;
 - volunteer hours;
 - member interests.
-

50. AI Recommendation Engine

The recommendation engine can consider:

User data

- interests;
- location;
- availability;
- previous activities;
- preferred group size;
- skill level.

Activity data

- category;
- location;
- time;
- participants;
- accessibility;
- difficulty.

Community data

- interests;
- activity;
- goals;
- projects.

The goal is:

Maximum relevance with minimum unnecessary exposure.

51. AI Ethics

AI should not:

- decide who someone must meet;
- expose private information;
- manipulate users into engagement;
- rank people by social value;
- discriminate based on protected characteristics;
- automatically make government decisions.

AI should provide:

Recommendations, explanations and connections.

Humans make the final decisions.

52. Technical Architecture

Possible architecture:

Frontend

- Next.js
- TypeScript
- React
- Tailwind CSS
- Mapbox/MapLibre

Backend

- Node.js
- TypeScript
- REST API / GraphQL

Database

- PostgreSQL
- PostGIS for geographic data

Authentication

- secure authentication system;
- OAuth where appropriate;
- role-based access.

AI

- recommendation engine;
- natural language assistant;
- community matching;
- anomaly/pattern detection;
- semantic search.

53. Data Model

Core entities:

User
Profile
Interest
Skill
Community
CommunityMember
Event
EventParticipant
Project
ProjectMember
Location
Organization
School
Business
Municipality
CommunityNeed
Connection
Recommendation
Achievement
Challenge
Report
Notification

54. Important Relationships

Example:

USER
↓
INTERESTS
↓
ACTIVITIES
↓
COMMUNITIES

↓
PROJECTS
↓
COLLABORATIONS
↓
COMMUNITY IMPACT

And:

USER
↓
ANONYMOUS AGGREGATED DATA
↓
CITY ANALYTICS
↓
COMMUNITY NEED
↓
CITY RECOMMENDATION
↓
NEW ACTIVITY
↓
USERS

This creates a **self-improving social ecosystem**.

55. Main Application Sections

1. Home

Personalized social opportunities.

2. Live Map

Real-world activities and communities.

3. Discover

Search people, activities, communities and projects.

4. My Network

Personal connection graph.

5. Communities

Groups and organizations.

6. Projects

Collaborative initiatives.

7. Events

Upcoming activities.

8. Bridge

AI-discovered cross-community collaborations.

9. AI Assistant

Natural-language social discovery.

10. Impact

Personal contribution and achievements.

56. Municipality Application

Separate interface:

Dashboard

- Social activity overview
- Community demand
- Activity density

- Opportunity gaps
 - Public-space usage
 - Emerging trends
 - Community needs
 - AI recommendations
-

57. Organization Portal

Schools, NGOs and businesses can:

- create communities;
 - publish events;
 - create projects;
 - recruit volunteers;
 - find participants;
 - collaborate with other organizations.
-

58. Future Integration

In a real 2036 implementation, Human Network could integrate with:

- public transportation;
- city maps;
- public spaces;
- libraries;
- schools;
- universities;
- sports facilities;
- cultural centers;
- event platforms;
- smart-city infrastructure.

Example:

User joins an event.

Human Network automatically provides:

Route → Public transport → Arrival time → Event → Return route

59. The 2036 Smart City Connection

Human Network could eventually interact with smart-city systems.

For example:

A public square is empty.

AI detects high demand for outdoor activities nearby.

The municipality can temporarily transform the space into:

Community Sports Zone

Another example:

A neighborhood has high demand for study spaces.

The system identifies an underused public facility.

Potential recommendation:

Convert part of the facility into a community study center.

60. Sustainability

The platform can encourage:

- walking;
- cycling;
- public transport;
- local activities;
- community volunteering;
- reuse of public spaces;
- local organizations.

Social connection becomes connected with sustainable urban development.

61. Business Model

Possible revenue sources:

Free Individual Accounts

Core social features remain free.

Organization Plans

Advanced tools for:

- businesses;
- schools;
- NGOs;
- event organizers.

Municipal Platform

Municipalities pay for advanced analytics and community-management infrastructure.

Sponsored Community Programs

Companies can sponsor:

- sports events;
- educational programs;
- environmental projects.

Sponsored content must remain clearly separated from organic recommendations.

62. MVP

You don't need to actually build all of Kosovo.

Build a convincing prototype around **one city**.

For example:

PRISHTINA 2036

Build:

1. Futuristic Kosovo/Prishtina map
2. User onboarding
3. AI social assistant
4. Activity discovery
5. Human matching
6. Community creation
7. Event creation
8. BRIDGE system
9. Community needs
10. Municipality dashboard
11. Social heatmap
12. Personal impact dashboard

That is enough to demonstrate the entire ecosystem.

63. Final Product Identity

Name

KOSOVO 2036 — HUMAN NETWORK

Category

Social Infrastructure / AI / Smart City / Community Technology

Core Feature

Kosovo Social OS

Signature Feature

BRIDGE — AI-powered community-to-community connection

Main Interface

Live Social Map

AI

Human & Community Intelligence

Target

People + Communities + Organizations + Cities

Main Purpose

Turning digital connectivity into real-world human connection.

64. The One-Sentence Pitch

KOSOVO 2036 — HUMAN NETWORK is an AI-powered Social Operating System that transforms Kosovo into a connected human network, helping people discover activities, form communities, find collaborators, solve local problems, and helping cities understand what their communities need.

**“Don't connect people to screens.
Connect people to each other.”**
